Chiarimento (Clarification) #8.1

Lot 1: Power Supply System for (VS) In-Vessel Coils

In Table 2 and Table 4 of the VS Technical Specifications, the maximum input power (available power) for the complete system is 2.5 MVA.

However, the estimation of the input power requires complex calculations due to the unconventional loads (see Figure 3 and Figure 5) and waveforms (see Table 3). Since the main goal is to ensure a good safety margin for the operations, a higher input power, up to 3.6 MVA, could be accepted.
